CRANIUM AIMS

PDFs of future UK climate extremes

2071-2100

e.g. 95th pcile of T

- 1: Incorporating RCM uncertainty: the CRANIUM methodology
- 2: Example changes in UK extremes by 2071-2100

1: Incorporating RCM uncertainty: the CRANIUM methodology

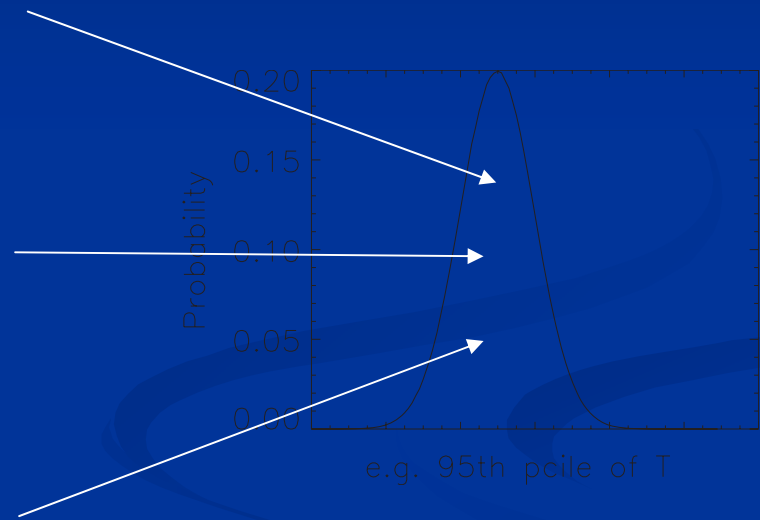

RCM 1

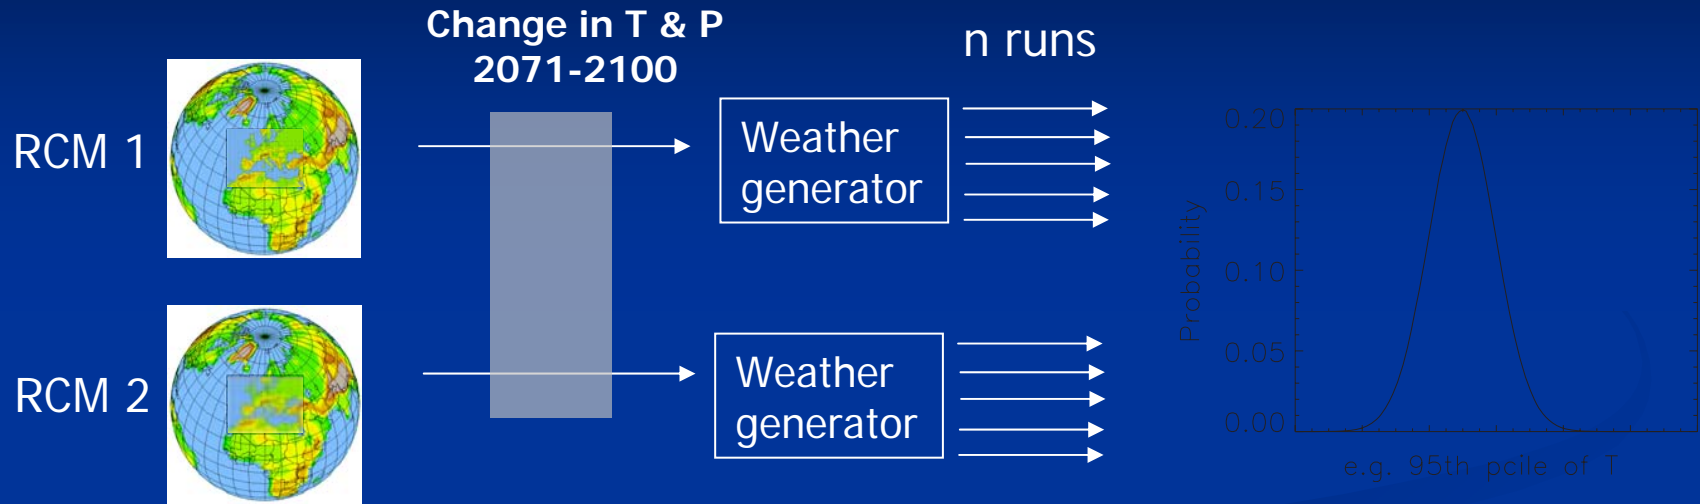

RCM 2

RCM ..n

1: Incorporating RCM uncertainty: the CRANIUM methodology

- The CRU weather generator:
- developed for BETWIXT (Watts *et al.*, 2004)
 - produces stochastic daily time series
 - mean and s.d. constrained

1: Incorporating RCM uncertainty: the CRANIUM methodology

Which climate extremes are we interested in?

- Heatwave duration
- Number of hot days
- Number of cold days
- Fraction of rainfall from intense events..

Station	Lat	Lon
1: Paisley	55.85	-4.43
2: Eskdalemuir	55.32	-3.20
3: Ringway	53.85	-2.28
4: Bradford	53.82	-1.77
5: Coltishall	52.77	1.35
6: Hemsby	52.68	1.68
7: Elmdon	52.45	-1.73
8: Heathrow	51.48	-0.45
9: Gatwick	51.15	-0.18
10: Yeovilton	51.00	-2.63

2: Example changes in UK extremes by 2071-2100

The number of **hot** days:

“The number of days in a year or season (within the future climate) where T_{max} exceeds the 95th percentile of the year/season daily T_{max} population within a reference climate”

Reference climate?

BETWIXT project conducted a suite weather generator simulations using *observed station* data as constraining parameters (rather than *future* changes) to obtain a number of years of control daily weather.

2: Example changes in UK extremes by 2071-2100

Elmdon: under A2 scenario forcing

1961-1990: 7 hot days

2071-2100:
31 hot days...

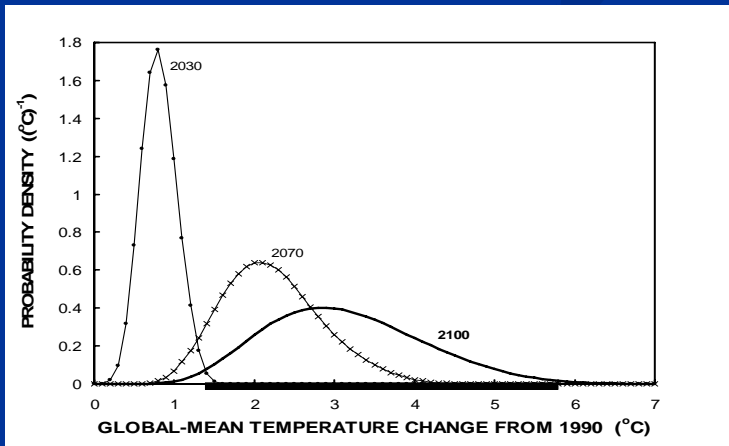

3: CONCLUSIONS

-consultation with stakeholders indicates PDFs are most useful tool for policy makers/stakeholdersRISK ASSESSMENT

-CRANIUM combines RCM/weather generator technique to enhance population size and incorporate RCM uncertainty

-some GCM –related uncertainty is also captured in mean perturbed PDFs...but n only = 2..

-incorporating GCM uncertainty will widen PDF but provide more realistic forecasts

Wigley and Raper [2001]
