

ACKNOWLEDGEMENTS

I would like to express my deep appreciation to Mick Kelly for his excellent supervision throughout the course of this work, for all his continuous help, guidance and straight talking during this research effort. Also, the select advice of Tom Holt and Grant Bigg has been key in shaping this thesis - thank you to both of them.

This research was sponsored by the Malaysia-UK Programme for the Conservation, Management and Development of Forest Resources under Sub-Programme B which focuses on the valuation of non-timber forest goods and services. Grateful appreciation is extended to the Government of Malaysia and the Director General of the Malaysian Meteorological Service for approving my 3-year study-leave in the United Kingdom.

Many thanks to the members of the Climatic Research Unit for providing continuous support during my time in Norwich. In particular, a special thanks to Mike Salmon for his computing support, making the running of the Unified Model successful, and to Mark New for his advice on the observational data.

Without the cooperation of members of the Numerical Weather Prediction Division of the Meteorological Office, U.K., this project would have been impossible. I would particularly like to thank Alan Dickinson, Dave Robinson, David Goddard, Clive Jones, Mussadiq Ahmed and Mike Hatton for their support regarding the use of the Unified Model and the data supplied.

Finally, a special note of appreciation is given to my wife and children, for their love and sacrifices which enabled the completion of this PhD research.
